Voluntary Results Feedback Form

- I am an examiner in Workgroup: Example: 1713
- Relevant prior art **found**, search results used as follows:
- 102 rejection
 - 103 rejection
 - Cited as being of interest.
 - Helped examiner better understand the invention.
 - Helped examiner better understand the state of the art in their technology.

Types of relevant prior art found:

- Foreign Patent(s)
- Non-Patent Literature
(journal articles, conference proceedings, new product announcements etc.)

➤ Relevant prior art **not found**:

- Results verified the lack of relevant prior art (helped determine patentability).
- Results were not useful in determining patentability or understanding the invention.

DT Journal

LA English

AB The present study was carried out, using inhibitors to secretory phospholipase A2 (sPLA2, 12-epi-scalaradial), cytosolic phospholipase A2 (cPLA2, AACOCF3), or calcium-independent phospholipase A2 (iPLA2, bromoenol lactone), to compare possible contributions of central nervous PLA2 isoforms to the development of allodynia after facial carrageenan injection in mice. C57BL/6J (B6) mice showed increased responses to facial stimulation using a von Frey hair (1 g force), at 8 h, 1 day, and 3 days after facial carrageenan injection. On the other hand, BALB/c mice did not show increased responses at any of the time points. In both B6 and BALB/c mice, intracerebroventricular injection of inhibitors to each of the three PLA2 isoforms significantly reduced responses to von Frey hair stimulation at 8 h and 1 day after facial carrageenan injection, but at 3 days after injection, only the sPLA2 inhibitor had an effect. Since BALB/c mice did not show increased responses after facial carrageenan injection, the reduction in responses actually indicates that there is loss of normal sensitivity to von Frey hair stimulation after intracerebroventricular injection of each of these inhibitors, in this strain of mice. The effects of PLA2 inhibitors are unlikely to be due simply to inhibition of arachidonic acid generation, since intracerebroventricular injection of arachidonic acid also had an anti-nociceptive effect. The above results support an important role of central nervous PLA2s in neurotransmission and pain transmission.

WO 2002-EP10957 W 20020930

AB The invention concerns a method to increase color fastness of dyed hair that includes the treatment of hair before or after the dyeing process with a composition that contains aryl, heteroaryl or cyclic aliphatic carbonyl compds. with the exception of anthraquinone derivs. The treatment compns. further can contain polymers, surfactants, direct dyes protein hydrolyzates, UV filters, but they do not contain oxidative dyes. Thus a hair dye contained (g): Hydrenol D 8.5; Lorol 2.0; Eumulgin B2 1.5; Texapon NSO 15.0; Dehyton K 12.5; sodium sulfite 0.5; ascorbic acid 0.2; 4,5-diamino-1-(2-hydroxyethyl)pyrazole x H₂SO₄ 1.03; ammonia (25% aqueous solution) to pH 10; water to 100. The dye was used in expts. for coloring hair. Samples were not treated after dyeing or treated with a composition that contained (g): Texapon NSO 15.0; Dehyton K 12.5; Hydrenol D 8.50; Lorol 2.00; Eumulgin B2 0.75; sodium sulfite 0.25; ascorbic acid 0.20; 3-dicyanethylene indane-1-one 1.16; ammonia (25% aqueous solution) to pH 10; water to 100. Treated and untreated hair samples were exposed to washing tests and color fastness was measured; the treated samples were superior by 4.44 units.

OS MARPAT 138:78134

AB The invention concerns a two component hair dye where the components are mixed in the presence of acids or bases if required to form a direct dye that can be removed with sulfite-containing reducing agents if required. The first component includes 1-benzopyrane-derivs.; the second component contains an electrophilic substance that is selected from the group of carbonyls, imines and 1-alkyl-quinoline derivs. Thus a first components was composed of (g): 7-hydroxy-4-methyl-2-phenyl-1-benzylpyrylium chloride 3.14; cetylstearyl alc. 12.0; Brij 78 P 2.8; ethanol 24.8; water to 100. The second component was a mixture of (g): 4-hydroxy-3-methoxy-benzaldehyde 1.75; cetylstearyl alc. 12.0; Brij 78 P 2.8; ethanol 24.8; water to 100.

AB Title compds. I and II [R1 = alkyl, hydroxyalkyl, polyhydroxyalkyl, etc.; R2 = CHR; R = H, alkyl; R3, R4 = alkyl, $(CH_2)_nRc$, $(CH_2)_nCORc$, etc.; n = 1-3; Rc = H, (un)substituted aromatic carbocycle, aromatic heterocycle, etc.; R5-R12 = H, alkyl, hydroxyalkyl, etc.; A- = anion of inorg. or organic acid] were prepared. The invention relates to hair dye kits containing 2-component hair dye compns. (A1 and A2) and a sulfite reductive decolorizing agent. Component A2 comprises of at least 1 carbonyl compd. and component A1 comprises of at least one indoline I or one 3H-indolium II deriv. For example, methylation indole of III, e.g., prep'd. from 5-bromo-2,3,3-trimethyl-3H-indole and 2,4-dimethoxyphenylboronic acid, with trimethyloxonium tetrafluoroborate afforded indolium IV in 55% yield. In coloration studies of bleached hair, 7-examples of compds. II (A1) in combination with 4-carbonyl compds. (A2) resulted in a range of hair coloring, e.g., a prepn. of indolium IV and 4-hydroxy-3-methoxybenzaldehyde produced a red color and white after reductive decolorization.

AB The invention relates to a method for immobilizing active agents on fibers, preferably hair, to a composition comprising active components (e.g., carbohydrates such as aldoses, hexoses,) and to the use for restructuring, restoring and pos. influencing hair fiber characteristics such as volume, shine, hold, body, tactility, electrostatic charge and resistance to heat, UV and IR radiation. Thus, a formulation contained 4-aminobutylgluconic acid amide 2.0, cetearyl alc. 5.5, Cetareth-20 2.0, sodium laureth sulfate 1.5, Polyquaternium-10 0.8, cocoamidopropylbetaine 0.5, ammonium hydroxide qs, and water to 100%. This was mixed with a second formulation containing citronellal 1.5, acrylate copolymer 0.5, sodium laureth sulfate 0.3, and citric acid (buffer) qs and water to 100%.

I

II

AB The invention relates to an agent for coloring fibers, especially hair, which is prepared before use by mixing an acidic component (A1), which contains at

least one enamine of formula (I) or its acid addition salt (II), with an alkaline component (A2), which contains at least one carbonyl compound and at least one primary amine. The invention also relates to a method for temporarily coloring hair according to which the coloring obtained by using the coloring agent is removed at any time by means of a decolorizing agent that contains sulfite. Thus a hair dye cream that resulted intensive red color contained (g): as component A1 1,2,3,3-tetramethyl-3H-indolium hydrogen sulfate 3.13 ; as A2 4-hydroxy-3-methoxy-benzaldehyde 1.76 ; methanolamine to pH 9.6; 6-O-palmitoyl-L-ascorbic acid 0.3; cetylstearylalc. 12.0; laurylethersulfate (12% ag. solution) 10.0; ethanol 23.0; water to 100.

I

II

AB The invention relates to hair dye kits containing 2-component hair-dye compns. (A1 and A2) and a reductive decolorizing agent; upon usage A1 and A2 are mixed. The component A2 comprises at least 1 carbonyl compound, and component A1 comprises at least 1 indoline derivative (I), or 1 3H-indolium derivative (II), R groups and A- are defined. Thus, the component A1 contained (g): 1,2,3,3,5-pentamethyl-3H-indolium iodide 0.30; lauryl ether sulfate (28% aqueous solution) 1, ethanol 2, water to 10%. The component A2 included (g): 3,5-dimethoxy-4-hydroxybenzaldehyde 0.17, lauryl ether sulfate (28% aqueous solution) 1, ethanol 2, water to 10%. By mixing 1 g of each component a pH of 8.1 was obtained. The dye was applied to bleached hair.

AB A composition for coloring hair fibers contains at least 1 aromatic aldehyde compound, at least 1 quinolinium derivative in addition to an alkanolamine. The invention also relates to a method for coloring fibers using the composition and to a multi-component kit for coloring and subsequently removing the color from fibers. Thus, a hair dye formulation contained

1-Ethyl-2-methylquinolinium chloride 3.45, 4-hydroxy-3-methoxybenzaldehyde 1.76, 6-O-palmitoyl-L-ascorbic acid 0.30, cetylstearyl alc. 12.00, 28% aqueous solution of lauryl ether sulfate 10.00, EtOH 23.0, and water to 100.0 g.

 AB Hair dyeing compns. contain a combination of aromatic or heteroarom.
 aldehydes and/or ketones with and heterocyclic compds. and e.g., amino
 phenols, amines, aromatic nitriles. Thus, mixture of 1-methyl-4-[2-(4-
 formylphenyl)ethenyl]quinolinium Me sulfate and 2,5-diaminotoluene sulfate
 gave a brown-orange color to the hair.

AB Nonoxidative coloring agents are obtained by reacting one or more carbonyl compds. with thiobarbituric acid or derivs. thereof. The dyes provide semipermanent shades on hair and have advantages over conventional direct or oxidative dyes such as low odor and reduced tendency to stain the skin. Thus, 5-[3-(4-(dimethylamino)phenyl)allylidene]-2-thioxodihydro-4,6-pyrimidinedione was obtained in 85% yield from thiobarbituric acid and 4-(dimethylamino)cinnamaldehyde; a blue shade was obtained on hair.

PRAI DE 1998-19820894 19980509

AB A 2-component nonoxidative hair dye contains (a) thiobarbituric acid or a

derivative thereof and (b) a carbonyl compound selected from saturated or unsatd. dialdehydes, diketones, or keto aldehydes, monoaldehydes or monoketones containing ≥ 1 chromophoric group, or quinones. These dyes provide a wide range of intense colors and shades which are resistant to washing and can be decolorized by oxidizing or reducing agents. They must therefore be applied after waving the hair. The components may be applied in either a 1-step or a 2-step procedure. Successive treatments with the dye may be applied to approach the desired shade without damaging the hair. In a 2-step procedure, 100 mL saturated (.apprx.0.72%) aqueous thiobarbituric acid solution was applied to the hair for 10-15 min at room temperature, followed (without rinsing) by 100 mL 1% citric acid solution containing 10 mmol malondialdehyde. After 10 min at room temperature, the hair was heated to 40-50° for 5-10 min and subsequently rinsed and shampooed. The dyed hair had a red color which did not fade on repeated washing.

AB An aqueous hair dyeing composition containing 0.05-5% dialdehyde with an amine dye generates the desired color in a shorter time than without the dialdehyde. Thus, a lock of blond hair was treated with a solution containing 0.2 parts p-aminodiphenylamine [101-54-2] and 0.2 parts o-phthalaldehyde [643-79-8] in 100 parts solution. The solution remained on the hair 4 min and was then rinsed to give the hair a rich black color. A similar treatment with only p-aminodiphenylamine gave a pale brown color.

AB A solution containing a dialdehyde and an N-compound is used to dye human hair. Thus, a lock of blonde human hair immersed for 5 min. in a solution containing 0.1% o-phthalaldehyde [643-79-8] and 0.1% triethanolamine [102-71-6] showed after rinsing a dark brown color. The preferred dialdehydes are o- and p-phthalaldehyde [623-27-8]; preferred N-compds. are mono-, di-, and tri-alkanolamines, and NH4OH [1336-21-6].

 AB The polypeptide chains of wool keratin were crosslinked by treatment with bifunctional aldehydes (i.e. glyoxal [107-22-2], terephthalaldehyde [623-27-8], and glutaraldehyde [111-30-8]), probably at the lysine and histidine basic groups. Treatment with the bifunctional aldehyde decreased the acid solubility and acid dye affinity of the wool, but increased the wool mech. properties. The solubility values were increased by treatment with monofunctional aldehydes. The equilibrium values for aldehyde takeup by the fiber were 0.6-0.7 mmole/g wool for bifunctional and 0.3-0.5 mmole/g for monofunctional aldehydes.
